JALSEA MARINE SERVICES LTD OSMOSIS REPAIRS

using
**International
GELSHIELD SYSTEM**

The Professional Treatment

Fast & Efficient work carried out by skilled craftsmen using specialised tools in our own purpose built workshops. DIY facilities are also available for the more adventurous boat owners, with help and guidance always at hand.

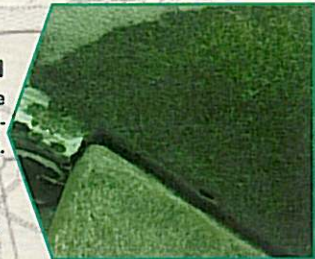

What is Osmosis?

Water penetration into the hull laminates, particularly on older boats reacting with traces of uncured resins causing blistering and cracking which if left untreated can be fatal to the boat.

The Treatment stage 1

The first stage is to strip the hull back to the fibreglass shell by gelcoat peeling and sand-blasting.

The Treatment stage 2

The stripped hull is then cleaned several times to remove harmful reaction products using a high pressure steam cleaner. It is aired before final drying in our heated resin shop. There the hull is coated with 5 layers of epoxy resin forming a permanent waterproof permanent waterproof repair.

The Treatment Stage 3

In between epoxy layers, the hull is filled and sanded to provide a smooth underwater profile and proper base for painting.

The Treatment Stage 4

A final coat of epoxy, 2 or 3 layers of anti-foul and the boat is back to service for many years.

The Finishing Touch

Jalsea Marine is an International Paints application centre. Topsides spraying can be carried out in all major paint systems very efficiently at this stage making an almost new craft again. Your boat will then be ready to return to the water or alternatively you may wish to take advantage of our full storage facilities.
